Patent Application of: Theodore D. Wugofski

SYSTEM FOR SCHEDULED CACHING OF IN-BAND DATA SERVICES

Patent No.: 450.222US1

BOX PATENT APPLICATIONS

Assistant Commissioner for Patents
Washington, D.C. 20231

We are transmitting herewith the following attached items (as indicated with an "X"):

- ☒ A Utility Patent Application comprising:
 - ☒ Specification (15 pgs, including claims numbered 1 through 43 and a 1 page Abstract).
 - ☒ 5 Sheet(s) of Formal drawing(s).
 - ☒ A signed Combined Declaration and Power of Attorney (3 pgs).
- ☒ An Assignment of the invention to Amiga Development LLC (2 pgs.) and Recordation Form Cover Sheet.
- ☒ A check in the amount of \$1788.00 to cover the Filing Fee.
- ☒ A check in the amount of \$40.00 to cover the Assignment Recording Fee.
- ☒ A return postcard
- Other: ____

☒ The filing fee has been calculated below as follows:

CLAIMS AS FILED					
	(1) No. Filed		(2) No. Extra	Rate	Fee
BASIC FEE	XXXXX		XXXXX	XXXXX	\$790.00
TOTAL CLAIMS	43 - 20	=	23	x 22 =	\$506.00
INDEPENDENT CLAIMS	9 - 3	=	6	x 82 =	\$492.00
MULTIPLE DEPENDENT CLAIMS PRESENTED					\$0.00
TOTAL					\$1788.00

If the difference in Column (1) is less than zero, enter "0" in Column (2).

Please charge any additional required fees or credit overpayment to Deposit Account No. 19-0743.

SCHWEGMAN, LUNDBERG, WOESSNER & KLUTH, P.A.

System for Scheduled Caching of In-Band Data Services

Related Applications

5 This application is related to the co-assigned and co-filed applications, "Method for managing multiple channel maps from multiple input devices in a multimedia system," "System for time-shifting events in a multi-channel convergence system," "Method and system for associating web sites to television programs," "Individualized parameter control for multiple media sources in a data processing system," "System for
10 combining electronic program guide data," and "Integration of Internet sources into an electronic program database list," all of which are hereby incorporated by reference.

Field of the Invention

15 The present invention is related to broadcast data services and in particular to scheduled caching of in-band data received from a broadcast data service.

Background of the Invention

20 One of the current trends in consumer electronics is the convergence of television technology and computer technology. Starting with the inclusion of a simple microprocessor chip in a television set, the convergence of the two technologies has evolved into sophisticated personal computers equipped with television tuners and large VGA monitors. Convergence systems enable the user to perform data processing tasks while simultaneously viewing a broadcast television program. The advent of personal satellite receivers has also opened up a vast range of broadcast content.

25 Data from an external source has long been available to personal computer through dial-up connections to private bulletin boards or public data services such as the Internet. Originally, the computer user had to "pull" the data into the computer by dialing into the service and requesting a download. Later, automatic dial-up utilities were introduced to automate the downloading process when the user was not present.

Most recently, "push" technology permits the data service to initiate downloads to a subscriber on a periodic basis assuming the personal computer is on or a scheduling mechanism is available to turn the computer on at the scheduled time.

5 In the world of broadcast media, such as television, a broadcast channel can transmit data streams as well as audio and video content to a properly equipped tuner/receiver. This transmission method is called "in-band" transmission and currently provides a subscriber with data services such as stock quotes, sports scores, and electronic program guides (EPG) for television schedules. There are multiple ways of transmitting data services in-band. Using EPGs as an example, StarSight Telecast, Inc. 10 places EPG data in the vertical blanking interval in the broadcast television signal while Direct TV™ and Echostar Communications Corp. use a portion of the MPEG2 (Motion Picture Experts Group) data stream broadcast from a digital satellite. The data stream is downloaded to a microprocessor, either in the television or in an attached device, and stored for later processing upon user request.

15 Because in-band data services frequently modify their data, an updated data stream must be downloaded periodically. However, because the data stream is broadcast in a channel only at certain times, the tuner/receiver must be on and tuned to the correct channel to capture the data at that time. This limitation poses problems for many users who are absent during the times the data stream is being broadcast and do 20 not want to leave their tuner/receiver powered on. Therefore, there is a need for a system that automatically downloads broadcast data from an in-band data service regardless of the presence of the user.

Summary of the Invention

25 A system for scheduling caching of in-band data operates as part of a computerized system having tuning circuitry to receive and store data broadcast in-band in a channel at a scheduled time. The scheduled caching system operates in conjunction with a real-time scheduling process provided by the computerized system. A scheduling process determines a scheduled time and channel for the in-band data broadcast and

invokes the real-time scheduling process to schedule a caching process for execution at approximately the scheduled time. When executed, the caching process instructs the tuning circuitry to tune to the scheduled channel, receives the in-band data from the tuning circuitry and stores the in-band data on mass storage for subsequent processing.

5 The caching process also powers on the tuning circuitry and parses the in-band data from other content broadcast in the channel if necessary. The in-band data can be broadcast in the vertical blanking interval of a television channel or in a portion of a digital satellite transmission channel. The scheduling process also presents a plurality of schedules to a user for selection. A digital processing system configured to support
10 the scheduled caching system is also disclosed.

Additionally, an information handling system is described as including a tuner and a scheduler. The tuner is capable of turning to a plurality of channels. The scheduler is configurable to determine a scheduled time and a scheduled channel for receiving information associated with the scheduled channel. The tuner tunes to the
15 scheduled channel at approximately the scheduled time to receive the information associated with the scheduled channel. The information can be in-band information, electronic program guide information, or Internet-related information. The scheduler is further described as including a real-time scheduling process, a scheduling process, and a caching process.

20 Because the scheduled caching system operates autonomously of the user, the user can select in-band data for delivery when the user is not present. The scheduled caching system will automatically power on the tuning circuitry and download the data from the channel at a scheduled time so that the user does not have to leave the tuning circuitry powered on and tuned to the proper channel. Furthermore, because the
25 scheduled caching system stores the data, the user need not be concerned with having to immediately process the data when the download is complete.

is equally applicable to other methods of in-band transmission of data services as well. Specifications for other in-band transmission methods can be obtained from organizations such as the European Broadcasting Union, from a data services provider such as Direct TV™, Intel Corp. or Data Broadcasting Corp., or from various public domain sources, such as the Internet.

The system for scheduled caching of data from in-band data services is part of a convergence system 100 shown in Figure 1A, such as the Destination personal computer system available from Gateway 2000, Inc., assignee of the present invention. The convergence system 100 incorporates tuner circuitry, such as tuner/receiver 180 in Figure 1B, into a digital processing system 101, such as a computer which is compatible with standard personal computer systems, and displays television signals and digital output on a large monitor 122 of VGA or better resolution. The tuning circuitry 180 is coupled through a system bus 184 to a microprocessor 186 which controls the operation of the tuner/receiver 180. The scheduled caching system is described in terms of software processes which execute within the microprocessor 186. The processes in the scheduled caching system can be implemented in software, hardware or firmware without departing from the scope of the invention.

One embodiment of a software architecture which provides the underlying infrastructure of processing and file input/output operations necessary for the execution of the scheduled caching system is illustrated in Figure 1C. The scheduled caching system operates as part of the system services 103 (ex.: EPG data services 109 for an EPG data service). The system services 103 also includes scheduling services 109 which enable the execution of programs at a specified time using a real-time clock in the microprocessor 186. The software architecture illustrated in Figure 1C is described in detail in co-assigned and co-pending patent application entitled "Architecture for Convergence Systems" filed on the same day as the present application and assigned to the same assignee, which application is hereby incorporated by reference.

In the embodiment shown in Figures 2A and 2B, the scheduled caching system 200 comprises two processes: a scheduling process 201 and a caching process 221. The

user of the convergence system 100 begins the execution of the scheduled caching system 200 through any of the well-known methods of software program initiation, such as clicking on an icon or typing in a command. The scheduling process 201 presents the user with a previously-input list of available data services, and their scheduled broadcast times and channels (steps 203 and 205). The user selects a data service broadcast time and channel from the schedules presented. The scheduling process 201 gets the selected schedule time and channel (step 207) and calls scheduler services (scheduler services 109 in Figure 1C) to schedule execution of the caching process at approximately the selected schedule time (step 209).

Scheduler services determines if there is a conflict with another scheduled event that also requires the tuning circuitry. If not, scheduler services schedules the caching process 221 to execute at a certain time based on the data service broadcast time and notifies the scheduling process 201 (step 211) that the execution of the caching process is successfully scheduled. The scheduling process 201 then exits. If there is a conflict, scheduler services returns an error code to the scheduling process 201 (step 211) and the scheduling process 201 again presents the user with the list of available services (step 205).

If no data services and schedules have been input (step 203), the scheduling process 201 prompts the user to provide a source for the schedules (213). The source of the schedule information can be a portion of the previously downloaded data stream, the Internet, hard media such as a floppy disk or CD-ROM, a dial-up service, or manual input. The scheduling process retrieves the schedules from the designated source (step 215) and presents the list to the user (step 205).

When the execution time for the caching process arrives, scheduler services activates the caching process 221 which then powers on the tuning circuitry (steps 223 and 225) if necessary, and instructs it to tune to the selected schedule channel (step 227). The caching process 221 receives the data stream from the tuning circuitry and parses the in-band data from the remainder of the channel content (step 229). In the current example, the caching process 221 extracts the data from the VBI of the

broadcast channel. If the data is delivered in a channel that does not contain other content, the caching process does not need to parse the data as part of step 229. The caching process 221 stores the data on a mass storage device, such as a hard disk, or in memory (step 231) for subsequent processing and exits.

- 5 In an alternate embodiment, the user selects multiple data service broadcast times and channels, and the scheduling process 201 calls the scheduler services to schedule multiple executions of the caching process 221.

10 It is to be understood that the above description is intended to be illustrative, and not restrictive. Many other embodiments will be apparent to those of skill in the art upon reviewing the above description. The scope of the invention should, therefore, be determined with reference to the appended claims, along with the full scope of equivalents to which such claims are entitled.

0900234-01099

What is claimed is:

1. A computerized-system for scheduled caching of in-band data broadcast in a channel comprising:
 - 5 a real-time scheduling process; and
 - a scheduling process operable for determining a scheduled time and channel for an in-band data broadcast, and for invoking the real-time scheduling process to schedule execution of a caching process at approximately the scheduled time, wherein the caching process is operable for instructing tuner circuitry to tune to the scheduled
 - 10 channel, for receiving the in-band data from the tuning circuitry, and for storing the in-band data for subsequent processing.
2. The computerized-system of claim 1, wherein the scheduling process is further operable for retrieving the scheduled time and channel from a source.
- 15 3. The computerized-system of claim 2, wherein the source is an in-band data broadcast.
4. The computerized-system of claim 1, wherein the caching process is further
- 20 operable for parsing the in-band data from other content broadcast in the channel.
5. The computerized-system of claim 3, wherein the in-band data is broadcast in a vertical blanking interval of a television channel.
- 25 6. The computerized-system of claim 5, wherein the in-band data is broadcast in a portion of a digital satellite transmission channel.
7. The computerized-system of claim 1, wherein the in-band data comprises electronic program guide data.

8. The computerized-system of claim 1, wherein the caching process is further operable for powering on the tuning circuitry.

5 9. A method of scheduled caching of in-band data broadcast in a channel comprising the steps of:

determining a schedule for the in-band data broadcast, wherein the schedule comprises a time and a channel;

instructing tuning circuitry to tune to the schedule channel at approximately the schedule time;

10 receiving the in-band data broadcast in the schedule channel; and
storing the in-band data on mass storage.

10. The method of claim 9, wherein the step of determining a time and channel comprises the steps of:

15 displaying a plurality of schedules to a user for selection; and
determining the time and the channel from the schedule selected by the user.

11. The method of claim 10, wherein the step of determining a time and channel comprises the steps of:

20 determining a source for the schedule; and
retrieving the schedule from the source.

12. The method of claim 11, wherein the source for the schedule is in-band broadcast data.

25

13. The method of claim 9, wherein the step of receiving the in-band data further comprises the step of parsing the in-band data from other content broadcast in the channel.

14. The method of claim 9, wherein the in-band data comprises electronic program guide data.

15. A computer-readable medium having computer-executable instructions stored thereon for performing steps comprising:

determining a schedule for the in-band data broadcast, wherein the schedule comprises a time and a channel;

instructing tuning circuitry to tune to the schedule channel at approximately the schedule time;

receiving the in-band data broadcast in the schedule channel; and

storing the in-band data on mass storage.

16. A digital processing system comprising:

a processor having real time clock circuitry;

tuning circuitry for tuning and receiving broadcast transmissions, the tuning circuitry communicatively coupled to the processor;

a computer-readable medium communicatively coupled to the central processor; and

a scheduled caching program executed from the computer-readable medium by the processor, wherein the scheduled caching program causes the real-time clock circuitry to schedule a subsequent execution of the scheduled caching program at approximately a scheduled time and the subsequent execution of the scheduled caching program instructs the tuning circuitry to tune to a channel, receives in-band data from the tuning circuitry, and stores the in-band data for subsequent processing.

17. The digital processing system of claim 16, wherein the scheduled caching program parses the in-band data from other content broadcast in the channel.

18. The digital processing system of claim 16, wherein the scheduled time and the channel are selected by a user of the digital processing system from a plurality of data service schedules.

5 19. The digital processing system of claim 18, wherein the scheduled caching program retrieves one of the data service schedules from an in-band source.

20. The digital processing system of claim 16, wherein the in-band data comprises electronic program guide data.

10

21. A computerized-system for scheduled caching of in-band data broadcast in a channel comprising:

a real-time scheduling process; and

15 a scheduling process having means for determining a scheduled time and channel for an in-band data broadcast, and for invoking the real-time scheduling process to schedule execution of a caching process at approximately the scheduled time, wherein the caching process has means for instructing tuner circuitry to tune to the scheduled channel, for receiving the in-band data from the tuning circuitry, and for storing the in-band data for subsequent processing.

20

22. The computerized-system of claim 21, wherein the scheduling process further has means for retrieving the scheduled time and channel from a source.

23. The computerized-system of claim 21, wherein the caching process further has
25 means for parsing the in-band data from other content broadcast in the channel.

24. The computerized-system of claim 21, wherein the caching process further has means for powering on the tuning circuitry.

0900364-01099
865010-1852060

25. An information handling system comprising:

a tuner tunable to a plurality of channels; and

a scheduler configured to determine a scheduled time and a scheduled channel from the plurality of channels for receiving information associated with the scheduled
5 channel,

wherein the tuner tunes to the scheduled channel at approximately the scheduled time to receive the information associated with the channel.

26. The information handling system of claim 25, wherein the information is in-band
10 information.

27. The information handling system of claim 25, wherein the information is electronic program guide information.

28. The information handling system of claim 25, wherein the information is Internet-related information.
15

29. The information handling system of claim 25, wherein the scheduler comprises:

a real-time scheduling process; and

a scheduling process which determines the scheduled time and the scheduled
20 channel, and invokes the real-time scheduling process to schedule execution of a caching process at approximately the scheduled time, wherein the caching process instructs the tuner to tune to the scheduled channel, receives the information associated with the scheduled channel from the tuner, and stores the information for subsequent
25 processing.

30. The information handling system of claim 29, wherein the scheduling process retrieves the scheduled time and the scheduled channel from information received from one of the plurality of channels.

201003534-4

31. The information handling system of claim 29, wherein the caching process powers-on the tuner.

5 32. A computer-readable medium having computer-executable instructions stored thereon for performing steps comprising:

determining a scheduled time and a scheduled channel to receive information associated with the scheduled channel; and

instructing a tuner to tune to the scheduled channel at approximately the scheduled time to receive the information associated with the scheduled channel.

10

33. The computer-readable medium of claim 32, wherein the information is in-band information.

15

34. The information handling system of claim 32, wherein the information is electronic program guide information.

35. The information handling system of claim 32, wherein the information is internet-related information.

20

36. A method for handling information comprising the steps of:

determining a scheduled time and a scheduled channel to receive information associated with the scheduled channel; and

instructing a tuner to tune to the scheduled channel at approximately the scheduled time to receive the information associated with the scheduled channel.

25

37. The method of claim 36, wherein the information is in-band information.

38. The information handling system of claim 37, wherein the information is electronic program guide information.

865070-43520057

39. The information handling system of claim 37, wherein the information is internet-related information.

40. An information handling system comprising:

- 5 a tuner having means for tuning to a plurality of channels; and
 a scheduler having means configurable for determining a scheduled time and
scheduled channel to receive information associated with the scheduled channel,
 wherein the means for tuning tunes to the scheduled channel at approximately the
scheduled time to receive the information associated with the channel.

10

41. The information handling system of claim 40, wherein the information is in-band information.

15

42. The information handling system of claim 40, wherein the information is electronic program guide information.

43. The information handling system of claim 40, wherein the information is internet-related information.

355070-4320067

Abstract of the Disclosure

A system for scheduling caching of in-band data operates as part of a computerized system to receive and store data broadcast in-band in a channel at a scheduled time. The
 5 scheduled caching system determines the scheduled time and channel for the in-band data broadcast and causes a real-time clock in the computerized system to schedule a subsequent execution of the scheduled caching system at approximately the scheduled time. When the scheduled caching system subsequently executes, the scheduled caching system instructs tuning circuitry in the computerized-system to tune to the scheduled
 10 channel, receives the in-band data from the tuning circuitry and stores the in-band data on mass storage for subsequent processing. The scheduled caching system also powers on the tuning circuitry and parses the in-band data from other content broadcast in the channel if necessary.

United States Patent Application

COMBINED DECLARATION AND POWER OF ATTORNEY

As a below named inventor I hereby declare that: my residence, post office address and citizenship are as stated below next to my name; that

I verily believe I am the original, first and sole inventor of the subject matter which is claimed and for which a patent is sought on the invention entitled: **SYSTEM FOR SCHEDULED CACHING OF IN-BAND DATA SERVICES.**

The specification of which is attached hereto.

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, § 1.56 (see page 3 attached hereto).

I hereby claim foreign priority benefits under Title 35, United States Code, § 119/365 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on the basis of which priority is claimed:

No such applications have been filed.

I hereby claim the benefit under 35 U.S.C. § 119(e) of any United States provisional application(s) listed below.

No such applications have been filed.

I hereby claim the benefit under Title 35, United States Code, § 120/365 of any United States and PCT international application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, § 112, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations, § 1.56(a) which occurred between the filing date of the prior application and the national or PCT international filing date of this application.

No such applications have been filed.

I hereby appoint the following attorney(s) and/or patent agent(s) to prosecute this application and to transact all business in the Patent and Trademark Office connected herewith:

§ 1.56 Duty to disclose information material to patentability.

(a) A patent by its very nature is affected with a public interest. The public interest is best served, and the most effective patent examination occurs when, at the time an application is being examined, the Office is aware of and evaluates the teachings of all information material to patentability. Each individual associated with the filing and prosecution of a patent application has a duty of candor and good faith in dealing with the Office, which includes a duty to disclose to the Office all information known to that individual to be material to patentability as defined in this section. The duty to disclose information exists with respect to each pending claim until the claim is canceled or withdrawn from consideration, or the application becomes abandoned. Information material to the patentability of a claim that is canceled or withdrawn from consideration need not be submitted if the information is not material to the patentability of any claim remaining under consideration in the application. There is no duty to submit information which is not material to the patentability of any existing claim. The duty to disclose all information known to be material to patentability is deemed to be satisfied if all information known to be material to patentability of any claim issued in a patent was cited by the Office or submitted to the Office in the manner prescribed by §§ 1.97(b)-(d) and 1.98. However, no patent will be granted on an application in connection with which fraud on the Office was practiced or attempted or the duty of disclosure was violated through bad faith or intentional misconduct. The Office encourages applicants to carefully examine:

- (1) prior art cited in search reports of a foreign patent office in a counterpart application, and
- (2) the closest information over which individuals associated with the filing or prosecution of a patent application believe any pending claim patentably defines, to make sure that any material information contained therein is disclosed to the Office.

(b) Under this section, information is material to patentability when it is not cumulative to information already of record or being made of record in the application, and

- (1) It establishes, by itself or in combination with other information, a prima facie case of unpatentability of a claim; or
- (2) It refutes, or is inconsistent with, a position the applicant takes in:
 - (i) Opposing an argument of unpatentability relied on by the Office, or
 - (ii) Asserting an argument of patentability.

A prima facie case of unpatentability is established when the information compels a conclusion that a claim is unpatentable under the preponderance of evidence, burden-of-proof standard, giving each term in the claim its broadest reasonable construction consistent with the specification, and before any consideration is given to evidence which may be submitted in an attempt to establish a contrary conclusion of patentability.

(c) Individuals associated with the filing or prosecution of a patent application within the meaning of this section are:

- (1) Each inventor named in the application;
- (2) Each attorney or agent who prepares or prosecutes the application; and
- (3) Every other person who is substantively involved in the preparation or prosecution of the application and who is associated with the inventor, with the assignee or with anyone to whom there is an obligation to assign the application.

(d) Individuals other than the attorney, agent or inventor may comply with this section by disclosing information to the attorney, agent, or inventor.
